

Armada 1 Known Problems

There are a number of well-known problems from being just annoy to not being able to start *Star Trek: Armada*. Most can actually be solved or worked around rather easily.

Sound Stutters on XP or Windows 2000

If you leave the [DirectX](#) settings as they are by default on Windows XP or Windows 2000, the sound will stutter, or the sounds will be chopped or not played at all. This can be fixed by turning off the sound acceleration or setting it to the lowest level.

To do this, enter the command `dxdiag` into the *Run* field of Windows. This should open a window that offers settings for DirectX. On the tab *Sound* you should see a slider bar with the description *Hardware acceleration* which you set to *No acceleration* (far left) or *Minimum acceleration* (second position from left). This often helps, or at least reduces the effects a bit. But there are also two other methods that do exactly the same.

Windows 2000

Start → Settings → Control Panel → Sounds and Multimedia → Audio tab → Advanced Audio Properties → Performance tab → Hardware acceleration to second lowest value, two times OK.

Windows XP

*Start → Settings → Control Panel → Sounds and Audio Devices → Volume tab → Advanced in section *Speaker settings* → System performance tab → Hardware acceleration to second lowest value, two times OK.*

If you rarely play Armada, you will want to reset the slider afterwards. It is likely the sound will be quite awkward in other applications, such as media players.

There is one last recommendation: The problem can be solved partly by installing newer sound drivers. Just try new drivers for the sound card. Maybe you can solve it this way. but it is rather unlikely.

Menu Music Too Loud

The volume of the music while not in a match/mission is not influenced by the audio settings. Meaning, it will always play at full volume, regardless of the settings you made for the music. The music volume setting only affects the music while in-game.

This problem may be solved by getting rid of the menu music altogether. While it is technically the same music as the Federation faction music, it is **not** coming from the same audio file. The menu

music file is *sounds\effects\Shellsd0.WAV*. (Which is identical to the file *sounds\music\Mfed300.wav*, which is played in-game.) So renaming the file, e.g. to *Shellsd0.WAV.bak*, will remove the music from the menus (but not when playing the Federation faction). The game will start without it.

An alternative could be to reduce the audio volume in said file directly with some sort of audio editor. But that is of course a static thing. It will still not react to your in-game music volume settings, if you choose to have it more or less loud, later. Changing it frequently does not seem reasonable. So, it is probably best to rename the file, if it gives your trouble on a general basis.

Multiple Screens Crash the Game

When using multiple screens, the game may crash right after starting it. Unplug your additional screen(s) and only leave the one attached, that you intend to use when playing the game.

Too High Resolutions Crash the Game

When using the 1.3 patch with *the CD version* and trying to set a resolution higher than 2048×1536, the game crashes. The 1.3 patch gives the game 16:9 and 16:10 resolutions in addition to the original 4:3 resolutions, if supported by the hardware. There are however, problems when going beyond x- or y-resolution of 2048. Any resolution in x or y direction higher than 2048 causes problems in the form of crashes back to the desktop. But there is a workaround for that problem, the [Legacy Direct3D Resolution Hack](#). Simply place the files inside your Armada 1 folder and enjoy. The GOG version will not have this problem.

[List of tested resolutions, that were used successfully without any additional means](#)

- 2048x1536x32
- 1920x1440x32

Too Long System PATH Variable Crashes the Game on Startup

When using the unaltered CD version on a modern system, it is very likely, that the game will never start. One of the reasons is a too long *PATH* variable of your Windows system. On modern Windows this is very common. On old Win9x or ME installations this was hardly ever any issue. You could of course try and remove unneeded parts of the *PATH* variable, but it is actually not necessary to alter your system settings. Simply use the GOG version or apply the [1.3 patch](#). There is also the possibility to fix this problem by altering the original game binary *Armada.exe*. It is however not advised to do that, as this makes the game basically incompatible with other player's Armada installation, that do not have the very same alteration.

Too Much RAM Crashes the Game on Startup

Similar to the above problem with the system's *PATH* variable, the game will crash if you have more than 2 GB of RAM. Back when Armada was released in 2000, 2 GB of RAM was certainly out of reach for most people. Today it is rather the opposite: A modern Windows system will not run with only 2 GB of RAM. So this problem is very common. In this case you cannot do a whole lot about that, except for using the GOG version or applying the [1.3 patch](#). There is also the possibility to fix this problem by altering the original game binary *Armada.exe*. It is however not advised to do that, as this makes the game basically incompatible with other player's Armada installation, that do not have the very same alteration.

Game is Visible But Cannot be Joined

This problem presents itself in the following way: One player opens a match on his computer. Another waits for the game to show up, which it eventually does (it may take a moment to find it). But when actually trying to access the match, the game claims, that the match has gone in the meantime (»The host of this game has been lost.«). Refreshing shows, the game is actually still open, but cannot be joined. Usually this happens, when the Windows firewall partially blocks the game. As a host allow the *Armada.exe* for free communications and this problem should be solved.

The Auto-Assimilator Sound Effect Does not Cease

It happens (rather often) that the [special weapon of the Assimilator](#) unit of the Borg is used, but once it is not active any more, its sound effect still continues indefinitely. This can easily be stopped by shortly opening the game's menus (**CTRL** + **X**) and closing it. Once the menu is closed, the sound will be gone. Similarly the sound will stop, when you pause the game for a moment (pressing **PAUSE**). Be aware that both solutions affect the other players in multi-player. When pausing, the game pauses for

all involved players. When opening the menus, the player will be displayed as unresponsive and the game pauses for the other players, too.

The Regeneration Sound Effect Does not Cease

Basically the same as the above problem: The [Regeneration](#) audio of the [Sphere](#) is considerably less noticeable, but it has the same stopping issues as the *Auto-Assimilator*. And the solution is the same as above: Press **PAUSE** or got to the menus for a moment. When un-pausing the match or returning to it, the sound will not come back.

Mouse Pointer Stays in the Center of the Screen

It happens from time to time, that the Windows mouse pointer is visible at the center of the screen and won't go away on its own. This can also be solved by opening the menus for a moment (**CTRL** + **X**). Once the menu is closed, the pointer will be gone.

Game Ends the Vendetta Mission with a Loss for No Reason

Reaching the last wormhole in mission 3 of the [Federation](#) campaign (Vendetta) can finish the mission without unlocking the last mission of the Fed campaign as you lose it anyways. So better save the game before finishing it.

Saved Games With Reversed Roles

When playing the [single-player campaign](#) and saving the game you may end up with a saved game that is damaged in a particularly way: The AI will have taken your place, any you take their's. The way to provoke this problem is as follows:

1. Start a *Instant Action* match.
2. Save it.
3. Stop it.
4. Load or start a single-player campaign mission.
5. Save the running campaign match over the previously saved *Instant Action* match (no manual deletion!)
6. Load the just saved mission again.

The reason for this is a bug in the save handling when overwriting a save. *Instant Action* matches consist of **two** files, an **.ias* file and a **.sav* file. The former does not exist for single-player saves. However, when saving a mission over an *Instant Action* match, only the **.sav* will be overwritten while the **.ias* stays untouched. That usually has the described effect or switching roles in the mission. If you intend on salvaging your mission save the problem can easily be solved by deleting the **.ias* file.
